BS Computer Science Graduate | Data Analyst (Python · SQL · Pandas)

Beat 11 other teams for Best Thesis with a 1.57 GWA carrying full course load. Then shipped three fully-built tools most students never attempt: a live analytics engine, a 20+ endpoint backend, and a statistical stock-forecasting app — solo, outside of class.

SKILLS

Core: Python · SQL · Pandas · NumPy · Excel · Data Cleaning · Descriptive Statistics · EDA
Tools: Flask · REST APIs · Supabase · Git · Chart.js/Recharts (dashboard-equivalent visualization)

EDUCATION

STI College Caloocan — B.S. Computer Science *2022 – Jul 2026*
GWA 1.57 | Best Thesis & Best Methods of Research – Campus ICTE Symposium (AY 2024–2025)

EXPERIENCE & PROJECTS

PASADA: Ride Hailing & Fleet Management Ecosystem *Dec 2024 – Nov 2025*
Data Analyst

- Validated system behavior and quantified research conclusions for a campus-level thesis by running SQL and Excel-based analysis on operational fleet/ride datasets.
- Documented system architecture and research methodology that earned Best Thesis and Best Methods of Research out of 12 competing groups at the campus-wide ICTE Symposium (AY 2024–2025).

Data Workbench – Full-Stack Data Analysis Web App *2026*
Solo Developer — Personal Project | Python · Flask · Pandas · NumPy · JavaScript · Chart.js

- Built a Flask/Pandas REST API that turns a table from a CSV, JSON, Excel, Word or PDF file into per-column statistics (mean, median, SD, missing/unique counts, IQR-rule outliers) and a correlation matrix, eliminating manual EDA calculation.
- Built 12 data-cleaning actions with undo and a change log, column ranking by statistical association with a chosen goal, and 5 Chart.js views including a correlation heatmap, with CSV and Excel export.

TRADR – Stock Forecasting & Prediction Game *2026*
Solo Developer — Personal Project | React 18 · TypeScript · Recharts · Twelve Data API · Groq API

- Built a block-bootstrap Monte Carlo forecast engine in TypeScript (5,000 simulated paths from a year of daily returns) that shows 68%/95% price ranges for any US stock or ETF, alongside trend, momentum, RSI(14) and volatility-regime signals.
- Validated the forecasts with a 12-month walk-forward backtest that builds each past forecast only from data available on that date and checks where the actual price landed.
- Turned the forecasts into an Up/Down prediction game that pays more for calls the model rated unlikely, with market-data and AI API keys kept server-side behind cached Vercel functions.

PopCulture – Consignment Marketplace & Admin Platform *Feb 2026 – May 2026*
Full-Stack Developer (OJT) | Dart (Shelf) · Supabase/PostgreSQL · Flutter

- Built 20+ REST API endpoints (Dart/Shelf) backing inventory, order fulfillment, seller ledgers, and payout workflows on Supabase/PostgreSQL.
- Cut sales-trend and top-seller reporting time by designing parallelized Postgres RPC calls that power live seller and admin analytics dashboards.

Personal Analytics Portfolio — Esports Performance Data *2025 – Present*

- Built and maintain a self-sourced dataset tracking pick rates, item builds, and matchup outcomes across 2 competitive titles (Dota 2, League of Legends), applying the same descriptive-stats/trend-analysis approach used in Data Workbench.
- Used as a recurring testbed to practice hypothesis-testing before applying it to PASADA's operational data — directly transferable to product/market analytics work.
